5.4. Weekly Refuse Removal Service.....	11
5.5. Energy for Cooking.....	12
5.6. Energy for Lighting	13

Citation: City of Cape Town (2023), Census 2022: Cape Town Trends and Changes, Research Analytics, Policy and Strategy Department, 14 pages.

Compiled by the Research Analytics unit, Policy and Strategy Department, City of Cape Town. 1996, 2001, 2011 and 2022 Census data supplied by Statistics South Africa. (Based on Census 2022 information available at the time of publishing, as released by Statistics South Africa.)

© City of Cape Town

1. Overview

The census provides the most comprehensive data on population size, demographic trends, living conditions, and other service delivery-related information. Statistics South Africa (Stats SA) conducted the latest census in February 2022, with the previous censuses conducted in October of 2011, 2001 and 1996. This data is foundational for data-driven decision-making and assists the City in effectively addressing the needs of its residents, while planning for a sustainable and inclusive future.

This initial release shows that that the population of Cape Town is 4 772 846 (27.6% higher than the 2011 Census, and a slowdown from previous intercensal period), and the number of households is 1 452 845 (36.0% higher than the previous census, and also a slowdown from previous intercensal period). Moreover, as can be seen in table 1 below, the average household size has declined further from 3.50 to 3.30 persons since the previous Census in 2011.

Table 1: Population and Households – Actual and Percentage change between censuses

Cape Town	1996	2001	2011	2022	% Change 2001 to 2011	% Change 2011 to 2022
Population	2 563 095	2 892 243	3 740 025	4 772 846	29.3%	27.6%
Households	653 099	777 389	1 068 515	1 452 845	37.4%	36.0%
Average Household Size	3.92	3.72	3.50	3.30		
Average Annualised Population Growth Rate¹		2.4%	2.6%	2.4%		

Note: The % change shows the growth of population and households between each census.

The population figures in the table above and figure below are to be used and quoted as the official Cape Town numbers for 2022.

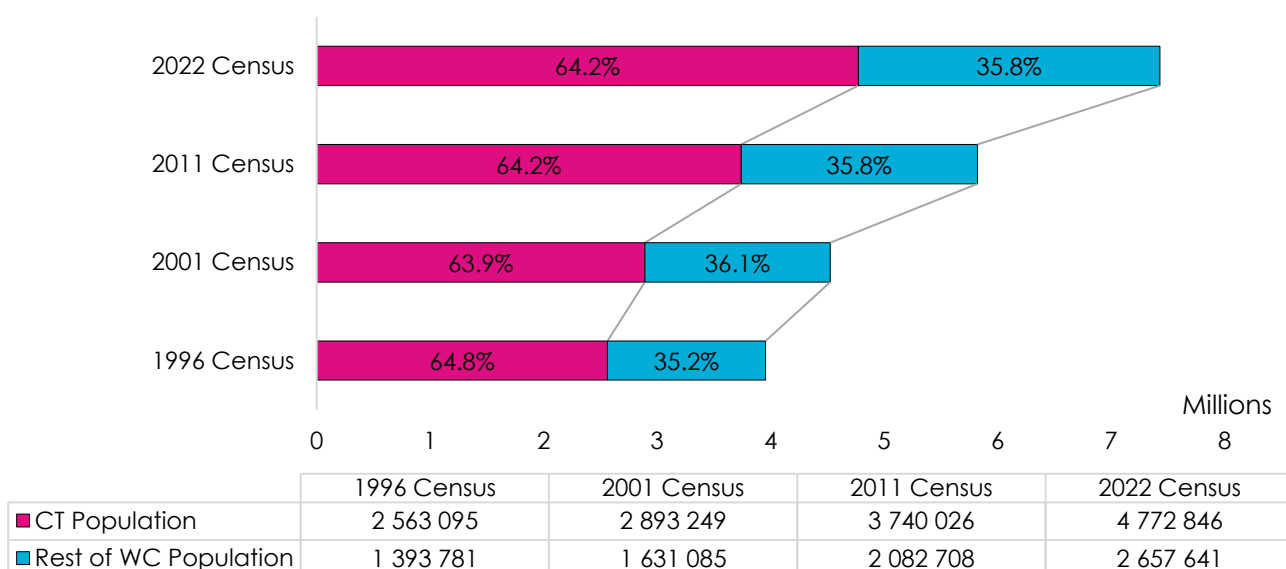

Figure 1: Cape Town vs Western Cape population contribution - 1996, 2001, 2011 and 2022 Census

¹ The Average Annualised population growth rate measures the mean annual growth rate of population for each year between each census.

2. Population Profile

The population profile provides a high-level snapshot of the city's demographic for age, sex and dependency ratios. It also shows the change of this composition between censuses.

2.1. Age

The population charts in figure 2 below, shows the age breakdown of each census. As can be seen over time, Cape Town is aging as the proportion of population in the lower age bands decreases and the higher age bands increases when looking at the trend from 2001 to 2022. Whilst Cape Town's population is still relatively young, i.e. 35.0% of the population are within the 15-34 age category, it is aging with the growth in the 35-59 and 60+ age brackets from Census 2011.

Figure 2: Age of the Cape Town Population

2.2. Sex

The population charts in figure 3 below displays a similar proportion of males and females when comparing Census 2001, Census 2011 and Census 2022. Across the past three censuses, the proportion of males is between 48% and 49%, while the proportion of females is between 51% and 52%.

Figure 3: Sex of the Cape Town Population

2.3. Dependency Ratio

As can be expected with an aging population, the child dependency ratio decreased to 31.6 (see figure 4 below) from 35.6 in Census 2011, with the old aged dependency increasing to 9.4 in Census 2022 from 8.0 in Census 2011 resulting to an overall dependency of 41.0 in 2022. The overall dependency ratio decreased from 43.6 in 2011 to 41.0 in 2022.

Figure 4: Dependency Ratios

Dependency ratio²: is an indicator of the potential dependency of children (0-14) and the elderly (65+) on those who are of working age in a population.

3. Household Profile

The household profile presents an overview of the city's residential landscape. It encompasses information such as the number of households, the rate of household growth, the average household size, types of dwellings households reside in, and tenure arrangements. The population and number of households in Cape Town have changed at different rates, with the number of households increasing at a higher rate than population.

Table 2: Households, Average Household Size and Household Growth between censuses

Year	Total Households	AHS	% Total Household Growth
1996	653 099	3.92	-
2001	777 389	3.72	19.0%
2011	1 068 515	3.50	37.4%
2022	1 452 845	3.30	36.0%

3.1. Average Household Size

The average household size in Cape Town has continuously decreased over the census periods, decreasing from 3.92 persons per household in 1996 to 3.30 persons per household in 2022 (see figure 5 below).

In figure 5 below, the average household size for Cape Town reflects notable shifts in residential patterns. The number of households are growing faster than the population highlighting the changing dynamics of urban living in the city, with potential implications for housing demand, infrastructure planning, and social support systems.

Figure 5: Households – Average household size per census

3.2. Type of Dwelling

The majority of households state they reside in formal dwellings, which has risen steadily from census to census. As per figure 6 below, 87.5% of the households now reside in formal dwellings whilst 11.7% reside in informal dwellings, and 0.8% in Other in 2022.

Figure 6: Households – Households living in Dwellings (number and percentage)

Note: A **formal dwelling** is a structure built according to approved building plans, i.e. house on a separate stand, flat or apartment, townhouse, room in backyard, rooms or flatlet elsewhere. An **informal dwelling** is a makeshift structure not erected according to approved architectural plans, for example shacks or shanties in informal settlements, serviced stands or proclaimed townships. They can also be in the backyards of other dwelling types. Informal dwellings are also referred to as a shack or shanty.

4. Education

This section provides a trend on the level of education of residents aged 20 years and older in the city over the past 3 censuses, and categorises the level in seven different categories.

4.1. Highest level of educational (20+ years)

As can be seen in figure 7 below, the categories of Grade 12 and Higher Education has increased from 2011. The Grade 12 category increased from 30.2% in 2011 to 36.5% in 2022, equating to an increase from 737 663 to 1 003 037. The Higher Education category increased from 16.2% in 2011 to 20.0% in 2022, equating to an increase from 395 442 in 2011 to 612 161 in 2022.

In addition, the percentage of residents over 20 years with No Schooling has decreased since 2001, but increased slightly from 1.8% in 2011 to 1.9% in 2022 which equates to an increase from 42 954 in 2011 to 57 805 in 2022, keeping in mind that those with the Other level of education also increased from 0.5% in 2011 to 1.1% in 2022 (i.e. 13 433 in 2011 to 35 146 in 2022). The Other equates to an increase of 21 713.

Figure 7: Highest level of education (20+ years) (number and percentage)

5. Household Services Profile³

In this section service delivery to households are viewed which consists of six areas of service delivery which includes source of water for household use, access to piped water in the dwelling, toilet facilities, weekly refuse removal, energy for cooking, and energy for lighting. Weekly refuse removal includes an answer in 2022 which was not used in the previous censuses.

5.1. Source of Water for Household Use

As can be seen from figure 8 below, while most households' source of water is from a regional/local water scheme (1 407 703 in 2022 from 1 039 796 in 2011), the overall percentage of households' with the source of water for household use from a regional/local water scheme has decreased (96.9% in 2022 from 97.3% in 2011). Households are therefore looking to use other sources of water as well.

Figure 8: Source of Water (number and percentage)

³ Questions for household services:

- **Access to piped water** - In which way does this household mainly get piped water for household use
- **Source of Water** - What is the household's main source of water for household use
- **Toilet Facility** - What is the main type of toilet facility used by this household
- **Weekly Refuse Removal** - How is the refuse/rubbish of this household mainly disposed of/removed
- **Energy for cooking** - What is the household's main source of energy for cooking
- **Energy for lighting** - What is the household's main source of energy for lighting

5.2. Access to Piped Water in the Dwelling

As can be seen from figure 9 below, the City has made a massive improvement in the number of households with piped water inside the dwelling (1 240 088 in 2022 from 801 744 in 2011, representing an improvement from 75.0% to 85.4%), while piped water inside the yard has decreased (106 423 in 2022 to 130 952 in 2011, representing a decrease from 12.3% to 7.3%). Piped water on community stand has also decreased from 128 660 in 2011 to 94 103 in 2022, however no access to piped water had a slight increase from 7 218 to 12 321.

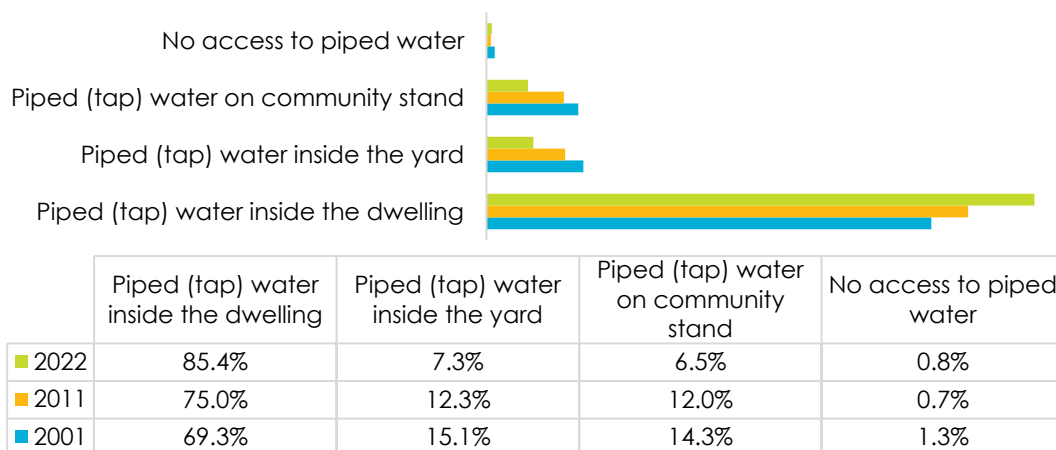

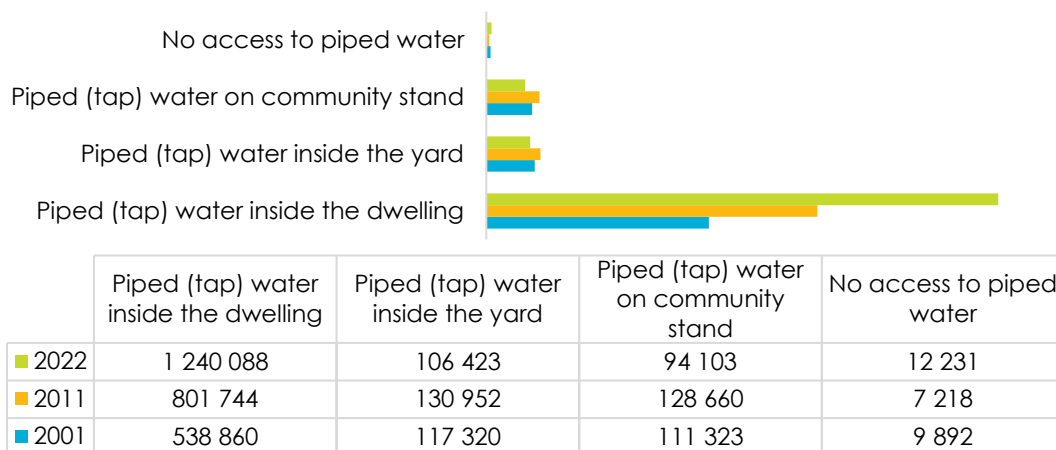

Figure 9: Access to Piped Water (number and percentage)

Notes: Seeks to determine the main source of water for households, and assesses whether the majority of households receive water inside their dwellings, on-site or at communal areas.

5.3. Toilet Facilities

As can be seen from figure 10 below, the City has improved access to flush toilets from 963 835 in 2011 to 1 356 649 in 2022, representing an increase from 90.2% to 93.4%. Pit toilets have decreased slightly from 4 122 in 2011 to 3 939 in 2022, however bucket toilets remain increased from 48 510 in 2011 to 53 308 in 2022. It is encouraging to see the drop in Other from 10 698 in 2011 to 3 378 in 2022, and None from 29 068 in 2011 to 14 383 in 2022.

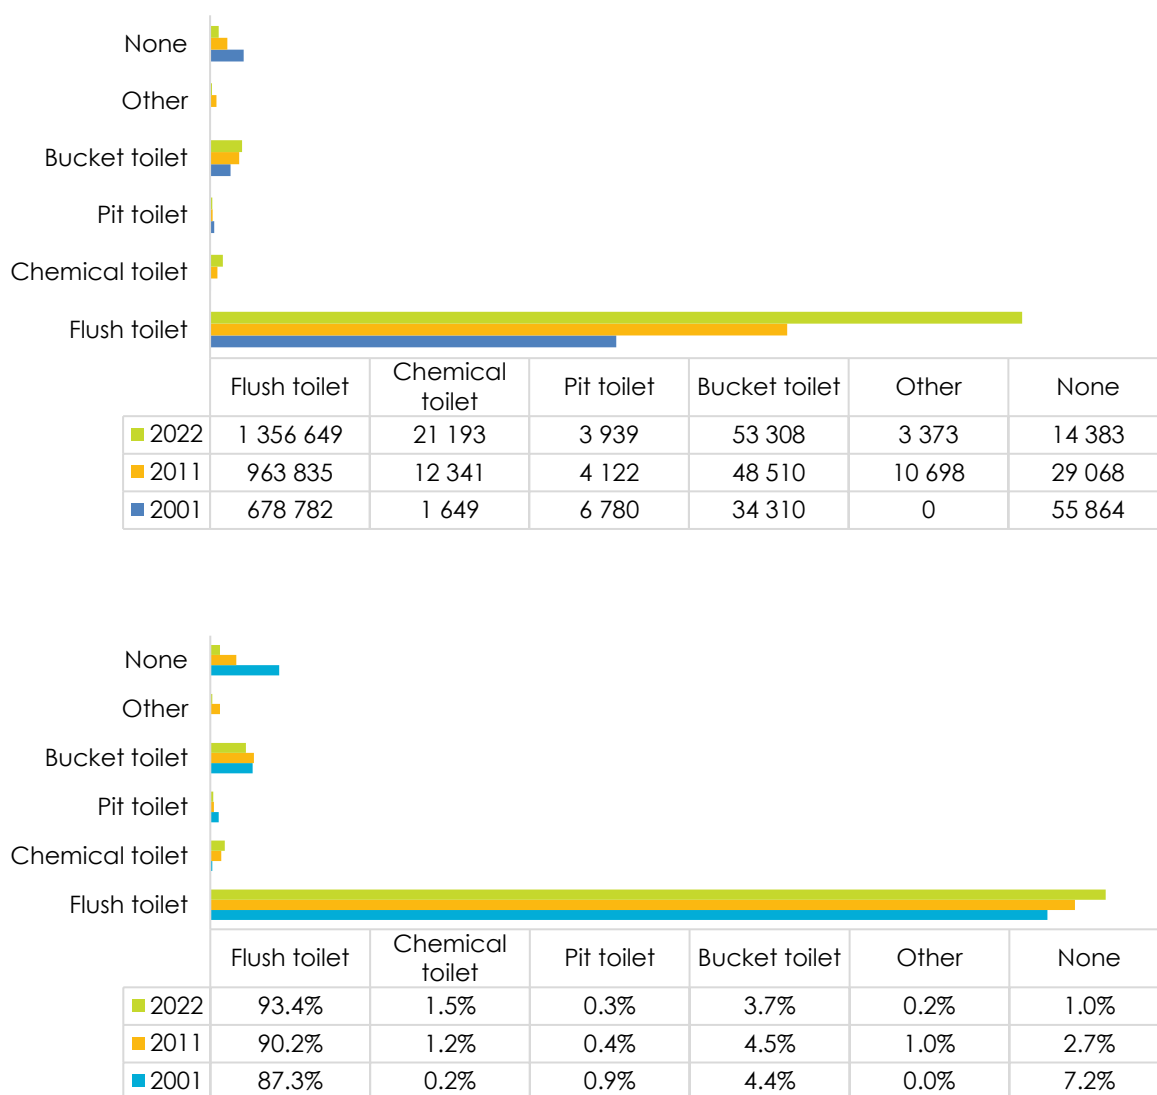

Figure 10: Toilet Facilities per Census (number and percentage)

5.4. Weekly Refuse Removal Service

As per figure 11 below, although households had an increase in refuse removed by a local authority at least once a week (1 311 036 in 2022 from 1 007 289 in 2011, representing a decrease in overall percentage movement from 94.3% to 90.2%). There was an increase in refuse being removed by a local authority less often (17 973 in 2022 from 7 261 in 2011), and also a new variable named “communal container/central collection point” in the Census 2022 survey which resulted in 82 749 using this type of method for refuse collection.

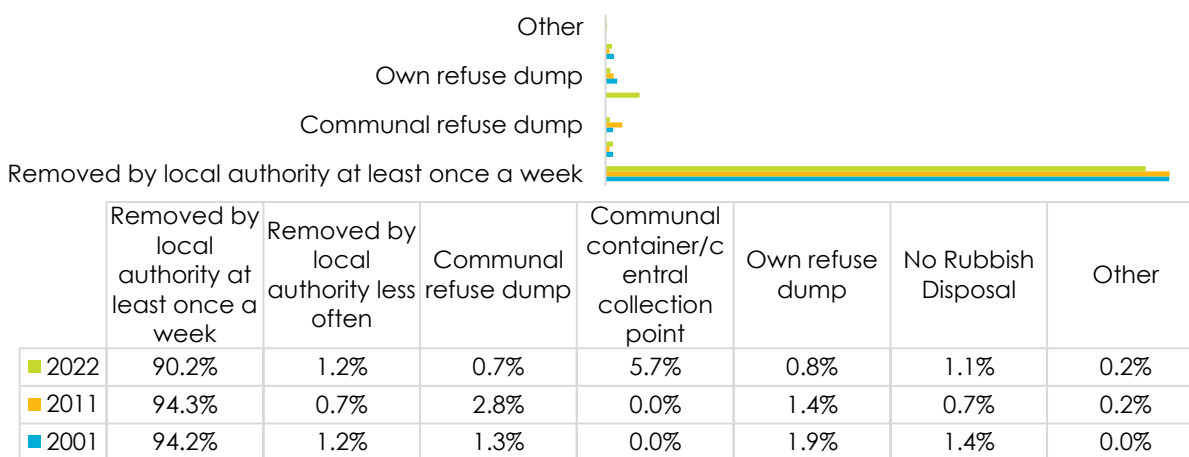

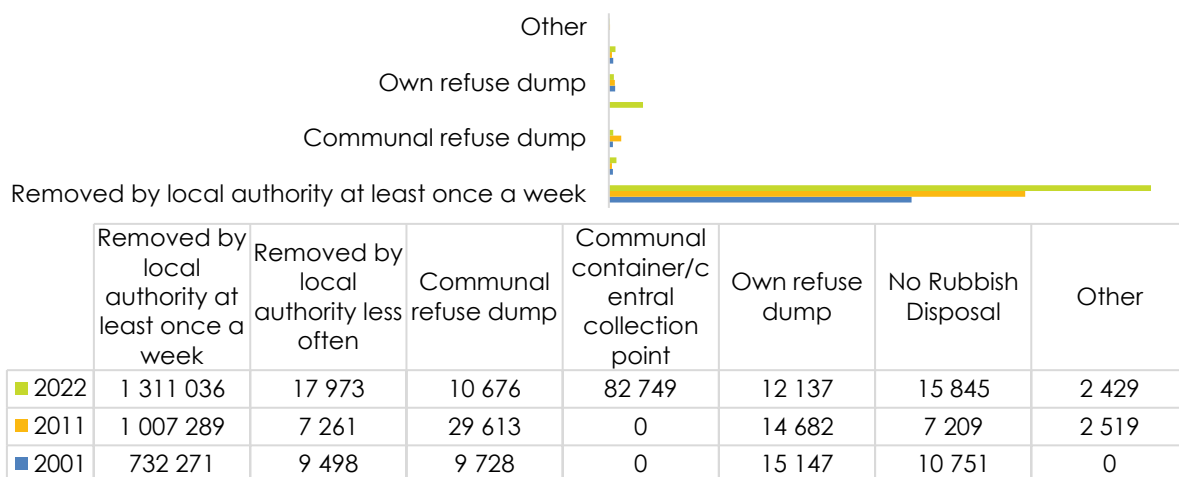

Figure 11: Refuse Removal per Census (number and percentage)

***Notes:** Determines how the household refuse or rubbish is removed. If more than one method is used to remove refuse/rubbish, the intention is to consider the one that offers better service.

5.5. Energy for Cooking

As per figure 12 below, Gas increased to 33.7% of households using this type of energy for cooking totaling 491 776 households. Electricity still remained the number one source of energy for cooking while all other type of energies used for cooking decreased from the previous census.

Figure 12: Energy for Cooking per Census (number and percentage)

5.6. Energy for Lighting

As per figure 13 below, candles and paraffin have decreased as an energy source for lighting due to consecutive increases of electricity used as the energy source for lighting from 690 279 households in 2001 (88.8%), to 1 004 328 in 2011 (94.0%), to 1 405 055 in 2022 (96.7%). Solar energy has started to increase from 1 877 in 2011 to 3 748 in 2022.

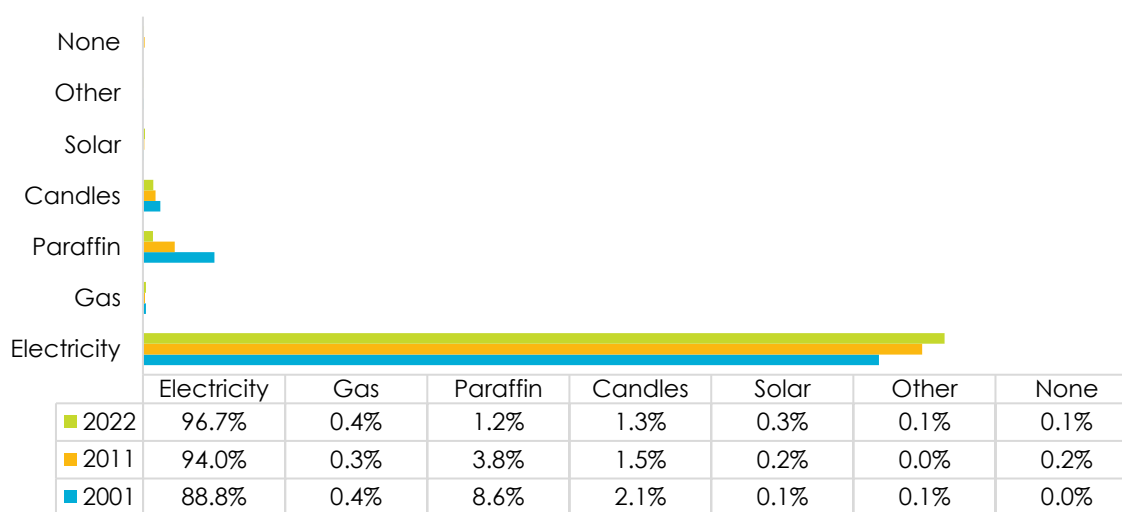

Figure 13: Energy for Lighting per Census (number and percentage)
